

MEMORANDUM

Date: May 23, 2016 (revised August 2, 2018)

Project #:
18048.0

To: Natalie Porter, Katie Jackson
County of El Dorado
2850 Fairlane Court
Placerville, CA 95667

Cc: Amy Lapin, EPS

From: Chirag Safi, Sara Muse

Project: Missouri Flat Master Circulation and Financing Plan Phase II

Subject: Technical Memorandum 1-6: Existing Traffic Analysis Results and Findings for the MC&FP Phase II Study Area

This memorandum summarizes the existing transportation conditions for the Missouri Flat Master Circulation and Financing Plan Phase II (MC&FP-II) project. The memo includes the operational results at study locations for the AM and PM peak hour conditions. Existing pedestrian, bicycle, and transit conditions are also inventoried. A safety assessment based on the Statewide Integrated Traffic Records System (SWITRS) was performed. Existing operational deficiencies are listed in this memorandum.

The subsequent sections in this memorandum describe the following:

- Study Locations
- Roadway Network
- Traffic Analysis Methodology and Standards
- Existing Traffic Operations
- Pedestrian Facilities
- Bicycle Facilities
- Transit Facilities
- Safety Assessment
- Key Findings

STUDY LOCATIONS

The study locations were identified based on the most recent projects, local circulation issues and a meeting with El Dorado County staff on February 16, 2016. A total of 23 intersections, 10 roadway segments, and 3 freeway mainline segments were analyzed for AM and PM peak hour conditions. The study locations are shown in Figure 1.

ROADWAY NETWORK

The characteristics of the roadway system near the study area are described below.

Missouri Flat Road is a two-lane to four-lane roadway that generally runs northwest-southeast between Green Valley Road (north of US Highway 50) and Pleasant Valley Road. Missouri Flat Road has two lanes for the majority of its route (and is identified as a Major 2-Lane Road in the El Dorado County General Plan). However the roadway widens to four lanes from Plaza Drive to Golden Center Drive to the south (and is identified as a 4-Lane Divided Road in the El Dorado County General Plan). The posted speed limit of Missouri Flat Road is 45 mph in the study area.

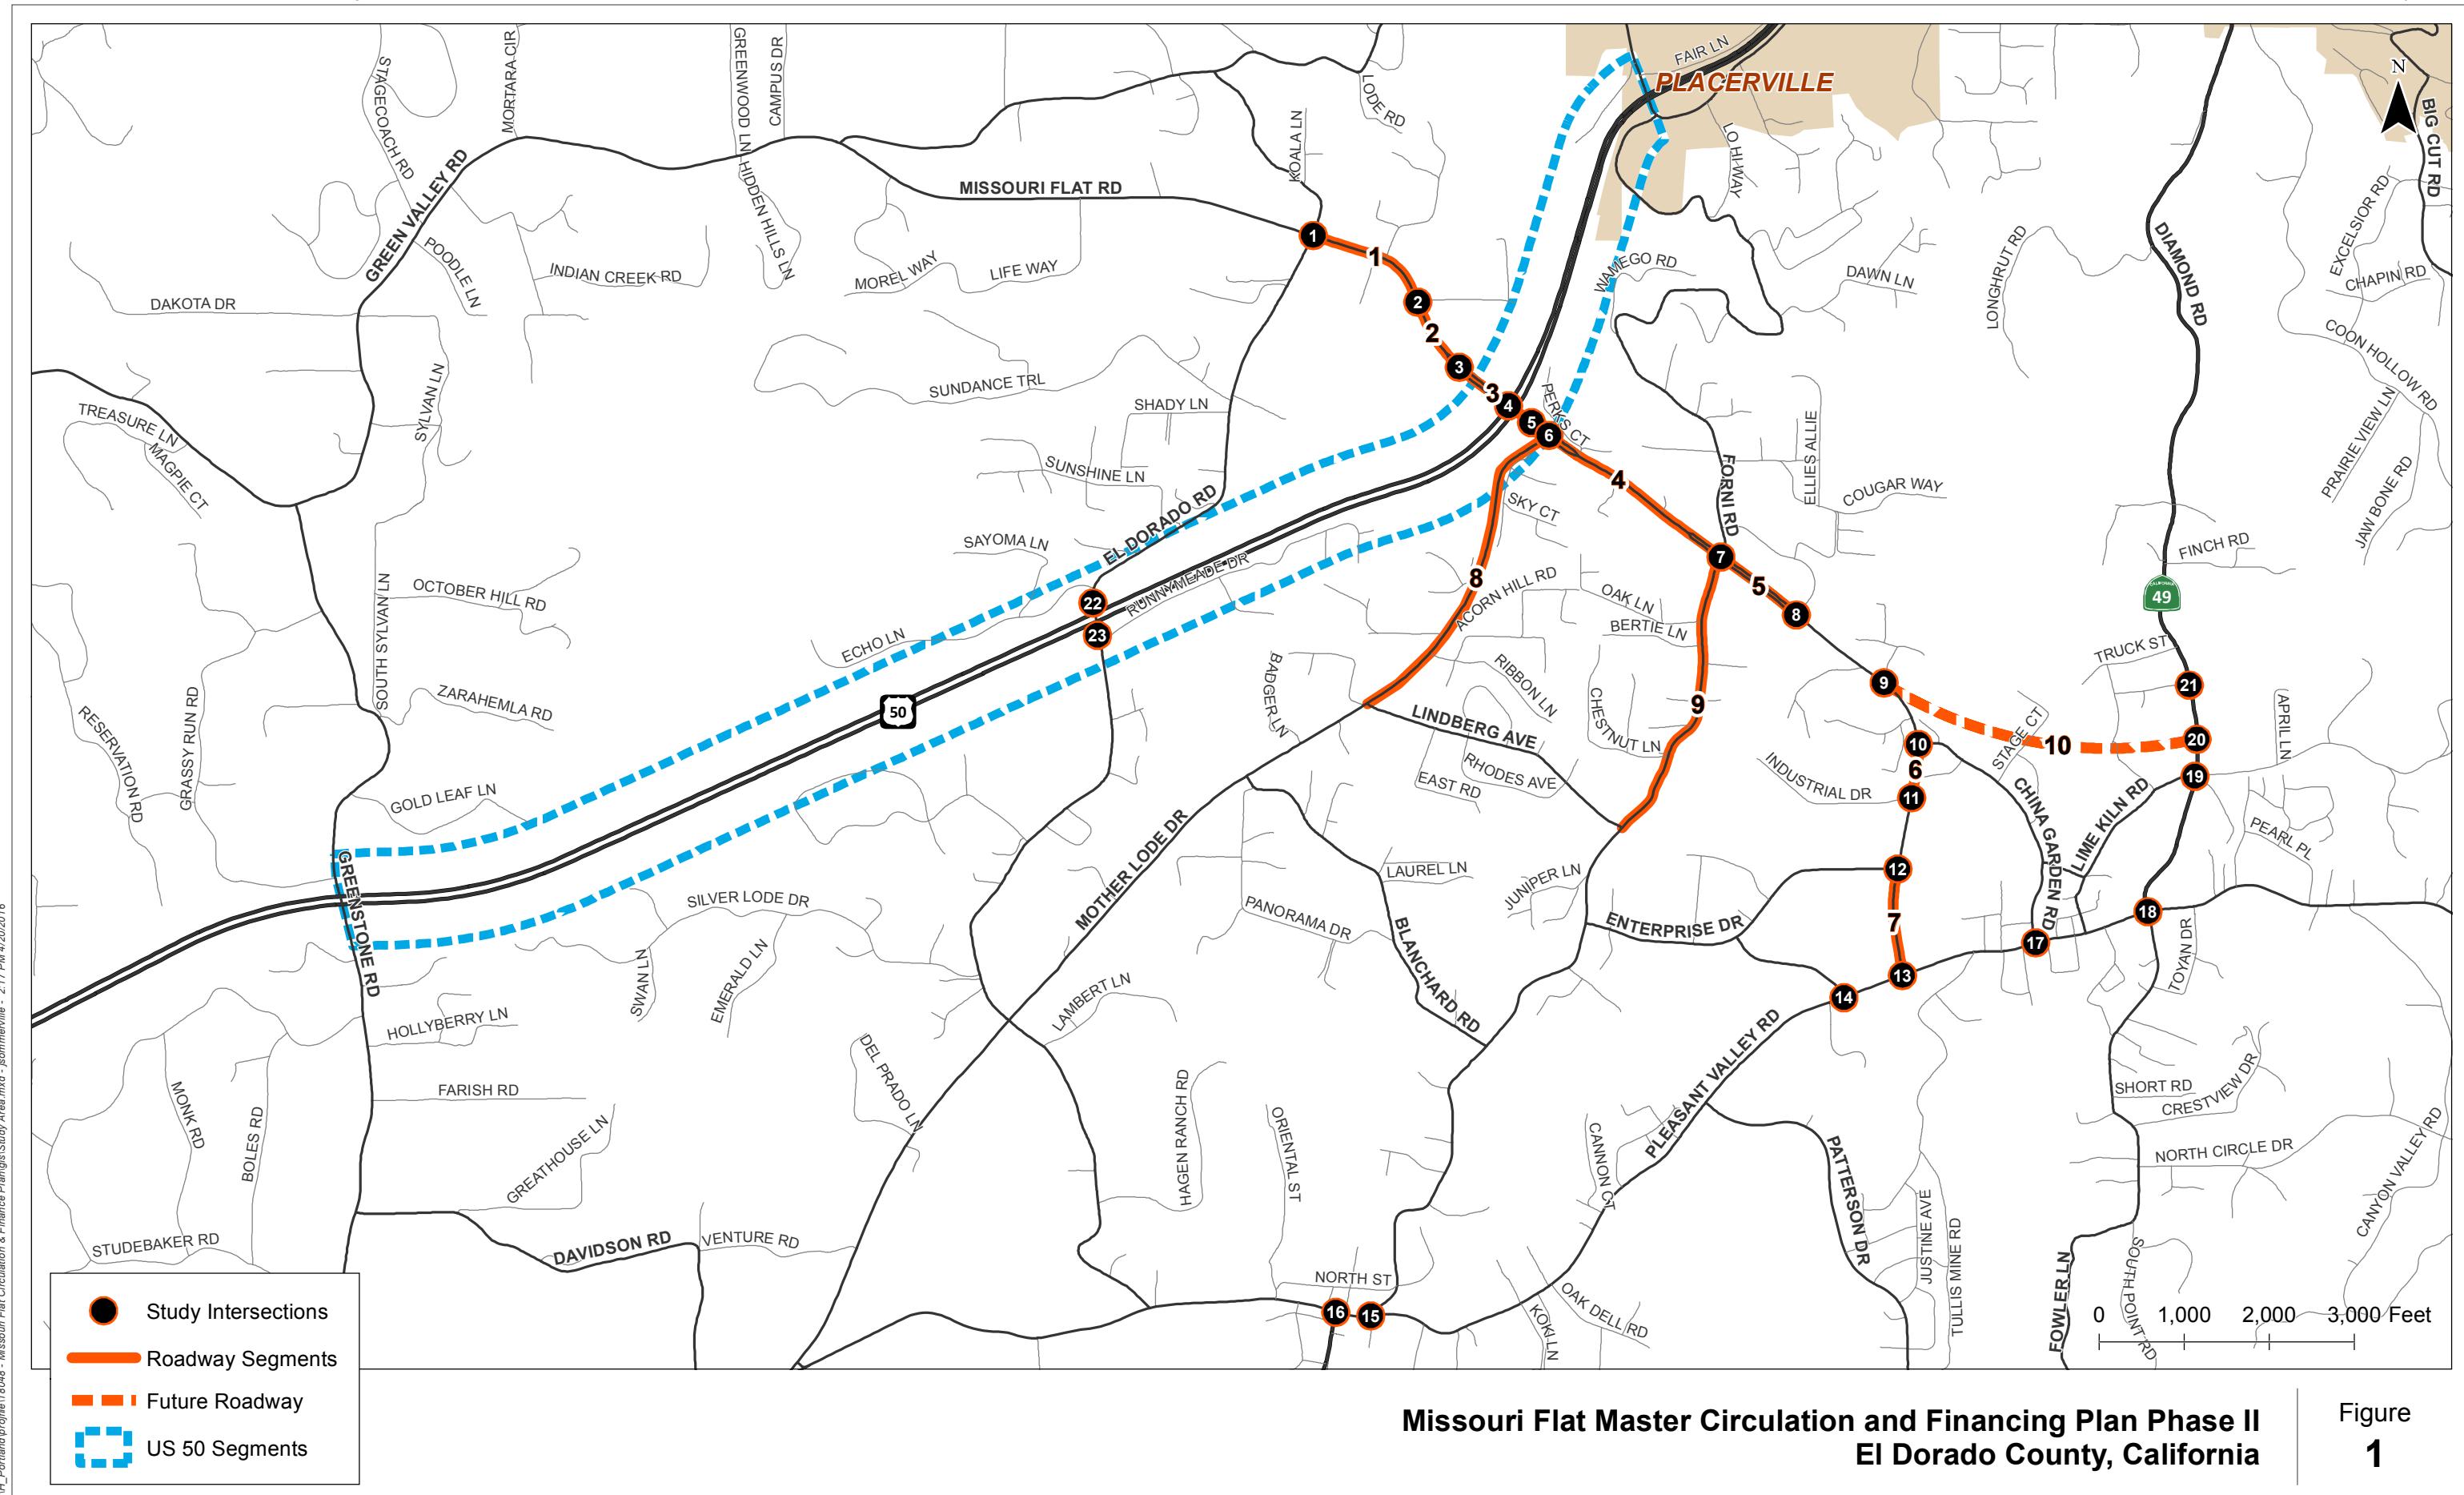

U.S. Highway 50 (US 50) is a four-lane east-west highway that is the primary regional transportation facility in El Dorado County, providing connections to Sacramento County, the Lake Tahoe area and the State of Nevada. US 50 is the major commuter route to employment locations in the greater Sacramento area and the major shipping route for goods movement by truck. Within the study area, US 50 is a four-lane conventional highway. Within other segments of US 50, there are additional truck-climbing and high occupancy vehicle (HOV) lanes.

Mother Lode Drive is a two-lane east-west roadway that intersects South Shingle Road in the west and Missouri Flat Road to the east. Mother Lode Drive is identified in the El Dorado County General Plan as a Major 2-Lane Road. The posted speed limit on Mother Lode Drive ranges from 35 to 50 mph.

El Dorado Road is a two-lane north-south roadway that is identified as a 2-Lane Regional Road in the El Dorado County General Plan. El Dorado Road begins at its intersection with Green Valley Road and terminates at the intersection of Pleasant Valley Road. El Dorado Road serves as a connection north and south of US 50. The posted speed limit on El Dorado Road is 45 mph.

China Garden Road is a two-lane east-west roadway that is identified as a 2-Lane Regional Road in the El Dorado County General Plan. China Garden Road connects Missouri Flat Road to Pleasant Valley Road. The posted speed limit on China Garden Road is 35 mph.

Enterprise Drive is a two-lane east-west roadway that is identified as a 2-Lane Regional Road in the El Dorado County General Plan. Enterprise Drive connects Missouri Flat Road to Forni Road through the Park West Business Park. The posted speed limit on Enterprise Drive is 25 mph.

Missouri Flat Master Circulation and Financing Plan Phase II

El Dorado County, California

Figure 1

Industrial Drive is a two-lane east-west local roadway. Industrial Drive is less than one-half mile in length west of Missouri Flat Road. The speed limit along Industrial Drive is 25 mph.

Black Rice Lane/Lime Kiln Road is a two-lane east-west roadway that is identified as a 2-Lane Regional Road in the El Dorado County General Plan. West of Diamond Road, Black Rice Lane provides a connection to residential uses. East of Diamond Road, Lime Kiln Road provides access to residential and commercial uses. The posted speed limit along both streets is 25 mph.

Bradley Drive is a two-lane east-west local roadway. Bradley Drive extends less than 0.25 miles west of Diamond Road. The posted speed limit along Bradley Drive is 25 mph. Bradley Drive provides access to the Materials Recovery Facility.

Commerce Way is a two-lane north-south roadway that is identified as a 2-Lane Regional Road in the El Dorado County General Plan. Commerce Way serves as a connection between Pleasant Valley Road and Enterprise Drive through the Park West Business Park. The posted speed limit on Commerce Way is 25 mph.

Diamond Road (SR 49) is a two-lane, north-south roadway that is identified as a Major 2-Lane Road in the El Dorado County General Plan. Diamond Road is designated as State Route 49 for its entire length from Sacramento Street to Pleasant Valley Road. The posted speed limit on Diamond Road ranges between 40 and 50 mph in the study area.

Pleasant Valley Road (SR 49) is a two-lane east-west roadway that intersects Mother Lode Drive to the west and Sly Park Road to the east. Pleasant Valley Road is identified in the El Dorado County General Plan as a Major 2-Lane Road and shares a route with State Route (SR) 49 from Golden Chain Highway to Diamond Road. The posted speed limit on Pleasant Valley Road within the study area ranges from 25 to 45 mph.

Diamond Springs Parkway is a planned east-west four-lane divided roadway that will connect Missouri Flat Road north of China Garden Road to Diamond Road (SR 49) north of Lime Kiln Road. The project is listed under El Dorado County's Capital Improvement Program (CIP) Current Year Work Plan as project #72334. The project is programmed to be completed by the year 2025. The roadway will include bicycle and pedestrian access with sidewalks and Class II bike lanes. Three bus turnouts will also be included along the new roadway.

TRAFFIC ANALYSIS METHODOLOGY AND STANDARDS

This section provides an overview of the analysis methodologies described in Technical Memorandum 1-5: Traffic Analysis Locations, Methodology and Assumptions, prepared by Kittelson & Associates, Inc. dated April 22, 2016. Refer to this memorandum regarding detailed assumptions, methods and tools for the technical analysis.

Intersection Analysis

Traffic operations at the study intersections were analyzed using the procedures and methodologies contained in the Transportation Research Board *Highway Capacity Manual* (HCM). For signalized and all-way stop controlled intersections, HCM procedures calculate an average control delay per vehicle, and assign a level of service (LOS) designation based upon the delay. For one or two-way stop controlled intersections, this methodology determines the LOS by calculating an average total delay per vehicle for each individual controlled movement. HCM methodologies were applied using Synchro/SimTraffic software packages developed by Trafficware.

Given the HCM analyses do not explicitly address the interaction of operations between closely spaced intersections, the following intersections were analyzed with micro-simulation using calibrated SimTraffic models:

- Missouri Flat Road and Plaza Drive
- Missouri Flat Road and US 50 Westbound Ramps
- Missouri Flat Road and US 50 Eastbound Ramps
- Missouri Flat Road and Mother Lode Drive
- Missouri Flat Road and Forni Road

A field visit was conducted to collect queue measurements at the intersection approaches during the AM and PM peak hours. The calibrated SimTraffic models used for the Diamond Springs Parkway Phase 1B Transportation Analysis Report were obtained from the County. The signal timings, geometrics and traffic parameters were checked and updated as appropriate. The updated SimTraffic models were then iteratively calibrated using the field observations based on the FHWA's Traffic Analysis Tools Volume III: Guidelines for Applying Traffic Microsimulation Modeling Software. The average results of 10 random runs with 15-minutes of seeding interval are summarized in this memorandum. The operational results are reported based on one hour recording, broken down into four 15-minutes intervals.

Roadway Segment Analysis

Roadway segment LOS was determined by comparing traffic volumes on the study roadway segments with peak hour LOS capacity thresholds.

Freeway Mainline Segment, Merge-Diverge Analysis and Weaving Analysis

For US 50, the basic freeway segment and merge-diverge LOS methodologies published in the HCM 2010 were applied. The HCM methods were implemented using validated HCM compatible spreadsheets for mainline and ramps analysis.

Level of Service Standards

Circulation Policy TC-Xd of the El Dorado County General Plan provides level of service standards for County-maintained roads and state highways as follows:

Level of Service (LOS) for County-maintained roads and state highways within the unincorporated areas of the county shall not be worse than LOS E in the Community Regions or LOS D in the Rural Centers and Rural Regions except as specified in Table TC-2. The volume to capacity ratio of the roadway segments listed in Table TC-2 shall not exceed the ratio specified in that table.

As such, the local roadways in the Community Regions are evaluated against the LOS E standard, while those in the Rural Regions and Rural Centers are analyzed against LOS D. Two segments listed in the Table TC-2 are included in the study area:

1. Missouri Flat Road from US 50 to Mother Lode Drive: maximum allowed volume to capacity ratio is 1.12
2. Missouri Flat Road from Mother Lode Drive to China Garden Road: maximum allowed volume to capacity ratio is 1.20

Caltrans facilities are also subject to Caltrans thresholds included in the Transportation Concept Report and Corridor System Management Plan. A threshold of LOS E is documented for US 50 between El Dorado Road and Placerville Drive. The SR 49 Transportation Concept Report established a threshold of LOS E for SR 49 segments within the study area.

The LOS criteria for the intersections, roadway segments, and freeway facilities are included in Appendix A.

EXISTING TRAFFIC OPERATIONS

This section summarizes traffic volumes and operational analysis results for the study area. The subsequent sections are as follows:

- Intersection Traffic Operations
- Roadway Segment Traffic Operations
- Freeway Traffic Operations

Intersection Traffic Operations

Intersection Traffic Volumes

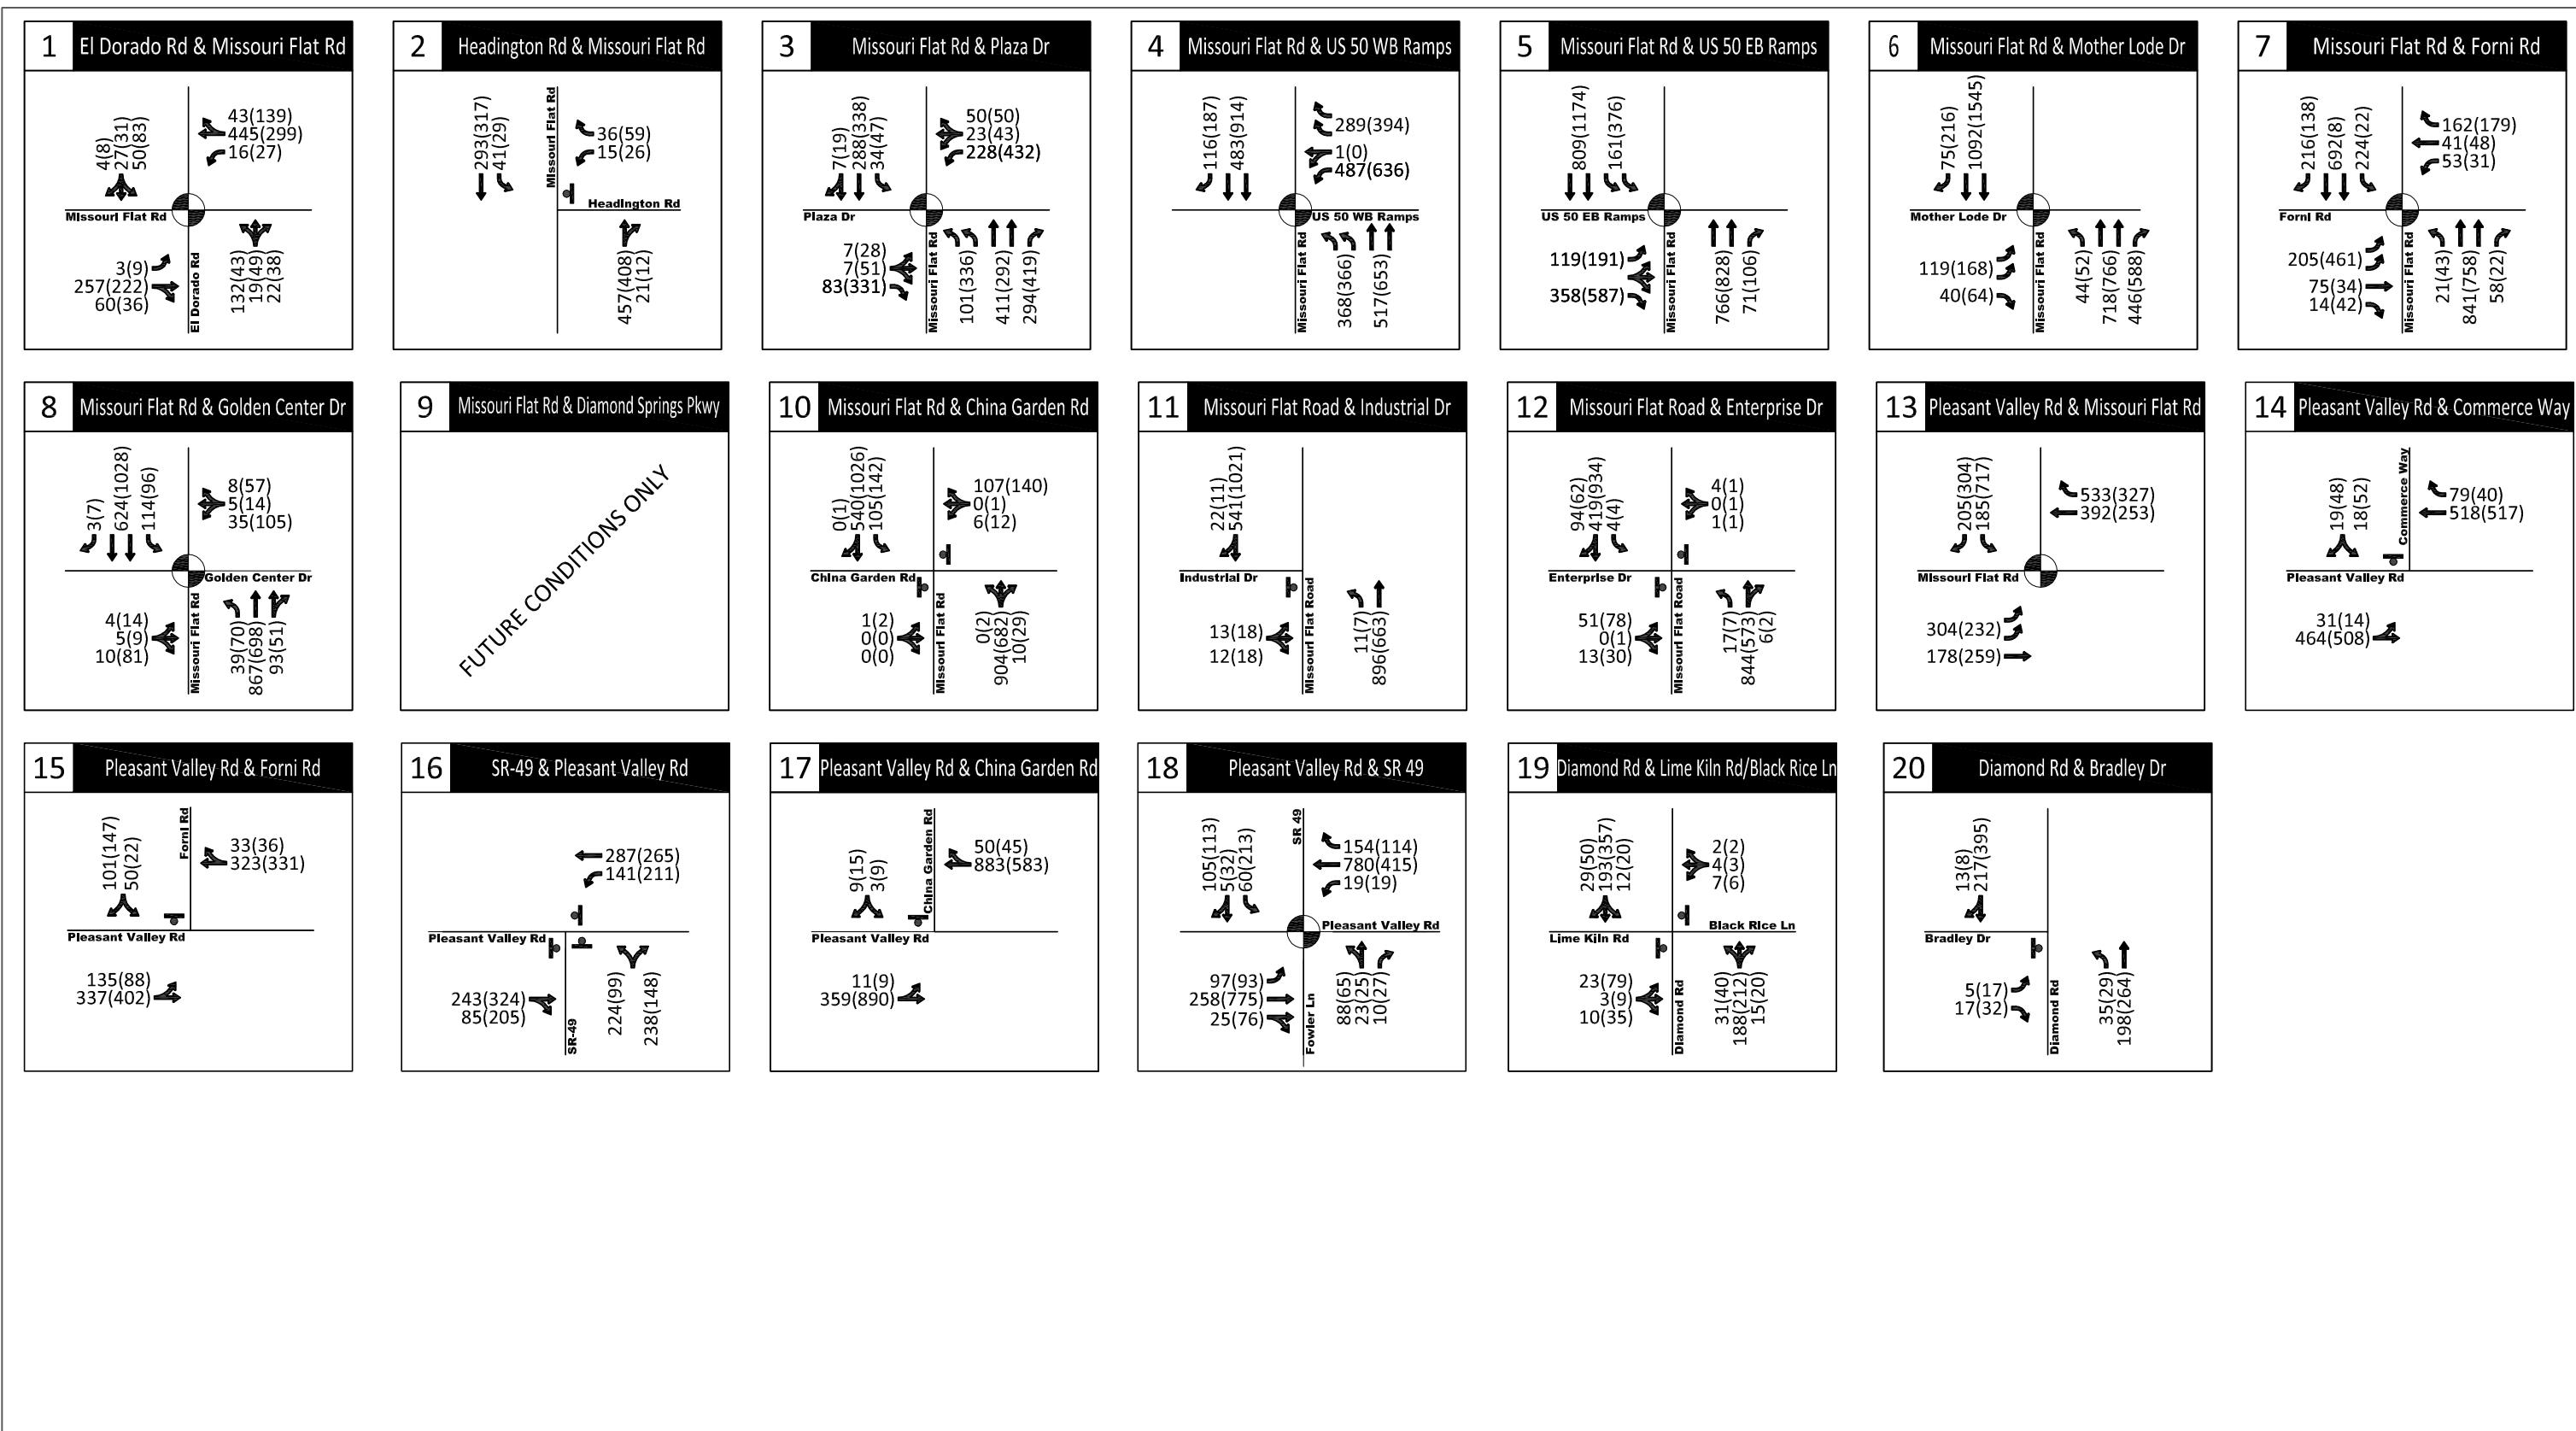

AM peak period (7 AM to 9 AM) and PM peak period (4 PM to 6 PM) intersection turning movement counts were obtained to determine existing traffic operations of the study facilities. Generally, turning movement counts at intersections were conducted in the year 2014 or 2015. The turning counts at one intersection, Pleasant Valley Road and Commerce Way (#14) were done prior to the year 2014. Turning movements at this intersection were adjusted up by balancing with the adjacent intersection, Missouri Flat Road and Pleasant Valley Road. Existing traffic volumes and lane configurations are shown in Figure 2.

Intersection Level of Service

Table 1 summarizes existing conditions LOS and delay for the study intersections during the AM and PM peak hours. Analysis worksheets are included in Appendix B.

While most of the intersections meet the County's LOS criteria, one side-street stop-controlled intersection, Missouri Flat Road/China Garden Road, exceeds operational criteria during both peak hours.

The operational results were compared with recently completed transportation and traffic studies in the area. The results presented herein are consistent with recent studies, with the exception of the Missouri Flat Road and China Garden Road intersection. The Diamond Springs Parkway (DSP) Transportation Analysis Report (Fehr & Peers, April 2016) estimated less delays and better LOS grades at this intersection. The differences in results can be explained by analysis techniques and methodologies. The DSP study applied SimTrafic simulation models to predict operational performance, while analysis results herein were based on the HCM method.

Notes:

Source: Kittelson & Associates, 2016

SSSC = Side Street Stop Control, AWSC = All Way Stop Control, N/A = not applicable for this scenario

Bold and shaded cells indicate that delays and LOS exceed the County or State's operational threshold

* Analyzed using SimTraffic micro-simulation models

1 Delay is reported in seconds / vehicles, based on HCM 2000 methods

2 Worse movement delay and LOS reported for SSSC. For AWSC and signal, overall average delay and LOS is reported.

Signal Warrant Analysis

The signal warrant analysis was performed to check whether or not intersections meet the peak hour volume warrant based on the 2014 California Manual of Uniform Traffic Control Devices (2014 CA-MUTCD). The results are summarized in Table 2. Both of the unsignalized intersections that were evaluated meet the peak hour volume warrant during one or both peak hours. Detailed calculation worksheets are attached in Appendix C.

Table 2: Signal Warrant Analysis Results

ID	Intersection	Signal Warrant Met? ¹	
		AM Peak Period	PM Peak Period
10	Missouri Flat Road & China Garden Road	Yes	Yes
12	Missouri Flat Road & Enterprise Drive	No	Yes

Note:

Roadway Segment Traffic Operations

Roadway Segment Volumes

The County of El Dorado collects hourly traffic volumes annually on key roadways. The 2015 traffic volumes on the study roadways were received from the El Dorado County. Generally, the counts were conducted in April 2015.

Roadway Segment Level of Service

Table 4 summarizes the existing AM and PM peak hour volumes and LOS for roadway segments. The study segments operate within the County LOS standards during the AM and PM peak hours.

US 50 Freeway Traffic Operations

US 50 Freeway Traffic Volumes

Freeway mainline volumes were obtained from the Caltrans Performance Measurement System (PeMS) during September and October 2015 for Tuesdays through Thursdays. The AM and PM peak hour average volumes were computed and used for subsequent analyses. The peak hour ramp volumes were derived from the ramp terminal intersection counts as shown in Figure 2.

US 50 Freeway Mainline Level of Service

Table 5 summarizes freeway mainline analysis results during the AM and PM peak hours. Detailed analysis worksheets are included in the Appendix D. The US 50 study segments operate within the acceptable standard.

US 50 Merge-Diverge Level of Service

Table 6 summarizes freeway merge diverge results during the AM and PM peak hours. Detailed analysis worksheets are included in the Appendix D. The US 50 merge diverge influence areas operate within the acceptable standard.

Table 4: Existing Roadway Segment Level of Service Results

ID	Road Name	Location	Area	Type	LOS Threshold	AM Peak Hour		PM Peak Hour	
						Two-Way Volumes	LOS	Two-Way Volumes	LOS
1	Missouri Flat Road	East of El Dorado Road	Community Region	2AU	E	806	A-C	827	A-C
2	Missouri Flat Road	North of Plaza Drive	Community Region	2AU	E	741	A-C	801	A-C

PEDESTRIAN FACILITIES

Existing pedestrian facilities are limited in the study area. Sidewalks are provided along Missouri Flat Road from Plaza Drive to the El Dorado Trail and range from six to ten feet. The El Dorado Trail is a multi-use path which currently extends from western El Dorado County to the Camino area east of Placerville. Most sidewalks in the study area do not provide a buffer (e.g., parking lane or landscaping) to separate pedestrians from moving traffic. Additionally, there are many locations with discontinuous sidewalks, or where sidewalks end abruptly. Most instances of fragmented sidewalks are along Pleasant Valley Road.

Marked crosswalks with standard striping are provided at all signalized intersections. The majority of intersections in the study area do not have ADA compliant curb-ramps. Some exceptions include the Missouri Flat Road and Plaza Drive intersection and the Missouri Flat Road and Golden Center Drive intersection.

Moderate pedestrian activity of approximately five to ten pedestrians occurred during the PM peak hour at the Missouri Flat Road and Golden Center Drive intersection and the Missouri Flat Road and Plaza Drive intersection.

There are several destinations within the study area that are expected to attract pedestrian activity. Some destinations include the following:

- Retail centers east and west of the Missouri Flat Road and Plaza Drive intersection
- Herbert C. Green Middle School
- El Dorado Trail
- Independence High School
- Union Mine High School
- Shenandoah High School
- Park West Business Park
- Towns of El Dorado and Diamond Springs

BICYCLE FACILITIES

The El Dorado County Bicycle Transportation Plan, 2010 Update (El Dorado County Transportation Commission) defines bicycle facilities within the study area as follows:

- **Class I Bikeway (Bicycle Trail):** A Class I bikeway is a facility that is physically separated from a roadway and designated primarily for the use of bicycles. Bicycle trails typically serve corridors not served by streets and highways, or where sufficient right-of-way exists to construct a separate facility parallel to the roadway.
- **Class II Bikeway (Bicycle Lane):** A Class II bikeway is a facility featuring a striped lane on the paved area of a road for preferential use by bicycles. It is located along the edge of the paved

area outside the motor vehicle travel lanes. A bicycle lane is typically identified by black and white “Bike Lane” signs, special lane striping, and may have “Bike Lane” stencils on the pavement.

- **Class III Bikeway (Bicycle Route):** A Class III bikeway route is a facility typically identified by green and white “Bike Route” guide signing only. There are usually no special lane designations, and parking may be permitted. Bicycle routes are established as a means to connect otherwise discontinuous segments of Class I or Class II bikeways.

The El Dorado County Bicycle Plan outlined the existing bike network within the study area. Existing Class II bike lanes are located along Missouri Flat Road from Forni Road to Plaza Drive on the east side of the street. El Dorado Trail is a Class I path within the study area that runs northeast-southwest through the project site south of Forni Road. The trail serves as a connection between Missouri Flat Road and the City of Placerville. The Bicycle Plan also outlined the proposed bike network within the study including the following segments.

Class I Facilities are proposed on the following segments within the study area:

- An extension of El Dorado Trail from Missouri Flat Road to Mother Lode Drive and beyond
- Pedestrian overcrossing at the US-50 and Missouri Flat Road interchange

Class II Facilities are proposed on the following segments within the study area:

- Commerce Way from Enterprise Drive to Pleasant Valley Road (SR 49)
- Diamond Springs Parkway from Missouri Flat Road to Diamond Road
- Diamond Road from Pleasant Valley Road (SR 49) to Diamond Springs Parkway
- Enterprise Drive from Forni Road to Missouri Flat Road
- Forni Road from Missouri Flat Road to Enterprise Drive
- Mother Lode Drive west of Missouri Flat Road
- Missouri Flat Road north of Plaza Drive
- Missouri Flat Road from the El Dorado Trail to Pleasant Valley Road (SR 49)
- Pleasant Valley Road (SR 49) from Ponderosa Road to Sly Park Road

Class III Facilities are proposed on the following segments within the study area:

- Union Mine Road south of SR 49
- Lindberg Avenue from Mother Lode Drive to Forni Road
- Patterson Drive south of SR 49

Existing bicycle activity within the study area is minimal. Most intersections have only a few bicyclists during the peak hours. Low bicycle activity of five to ten bicyclists per day was observed at the intersections near the US 50 and Missouri Flat Road interchange.

The El Dorado Trail is the major destination for multi-modal users within the study area. There is a Class I bike path proposed east of Missouri Flat Road that runs parallel to the US 50 Eastbound highway along Perks Court which terminates at Placerville Drive.

TRANSIT FACILITIES

Within the study area, transit service is provided by the El Dorado County Transit Authority (EDCTA). The EDCTA offers local fixed route, regional commuter route, dial-a-ride, and paratransit services. There are seven local fixed routes, four of which have stops on Missouri Flat Road and/or Pleasant Valley Road. Amtrak provides its Thruway Service (bus service) to customers in Placerville. In order to use this service, customers make reservations with Amtrak to provide bus service to an Amtrak station. One of the 12 park-and-ride facilities along US 50 is located in the study area adjacent to Mother Lode Drive.

A transfer center is located at the intersection of Missouri Flat Road and Forni Road serves five bus routes. The Diamond Springs route is the only one that runs south along Missouri Flat Road. This route has hourly service on weekdays and travels along both Missouri Flat Road and Pleasant Valley Road.

The Diamond Springs route runs from the Folsom Lake College – El Dorado Center along Missouri Flat Road to Pleasant Valley Road. The Diamond Springs route travels along Pleasant Valley Road between Oriental Street and Pearl Place. Weekday service is provided from 7:00 AM to 6:48 PM with one hour headways.

The Placerville route runs from the Missouri Flat Transfer Station to the Gold Country Inn in Placerville. Weekday service is provided from 7:00 AM to 7:00 PM with one hour headways.

The 50 Express route is a commuter route that runs from the Missouri Flat Transfer Station to the Folsom Iron Point light rail station. Weekday service is provided from 6:00 AM to 7:00 PM with one hour headways.

The Sacramento Commuter route provides 11 morning trips and 11 afternoon trips between El Dorado County and downtown Sacramento. Weekday service is provided in the morning from 5:00 AM to 10:30 AM and in the afternoon from 2:00 PM to 6:30 PM.

SAFETY ASSESSMENT

Collisions data for the study area was extracted from the Statewide Integrated Traffic Records System (SWITRS) from January 1, 2012 to December 31, 2014. There were a total of 59 reported collisions within the study area as reported in Table 7 below.

Table 7: Collision Frequency by Year

Intersection	2012	2013	2014	Total
Missouri Flat Road and El Dorado Road	0	2	0	2
Missouri Flat Road and Plaza Drive	2	1	1	4
Missouri Flat Road and US 50 Interchange*	5	8	8	21
Missouri Flat Road and Forni Road	1	1	0	2
Missouri Flat Road and Golden Center Drive	0	0	1	1
Missouri Flat Road and China Garden Road	0	1	1	2
Missouri Flat Road and Industrial Drive	1	0	2	3
Missouri Flat Road and Enterprise Drive	0	0	2	2
Missouri Flat Road and Pleasant Valley Road (SR 49)	3	1	2	6
Pleasant Valley Road and SR 49 (West)	1	1	1	3
Pleasant Valley Road (SR 49) and Diamond Road/Fowler Lane	1	0	1	2
Diamond Road and Black Rice Lane/Lime Kiln Road	1	1	1	3
Diamond Road and Bradley Drive	1	0	1	2
El Dorado Road and US 50 Interchange*	2	4	0	6
Total	18	20	21	59

* SWITRS data does not distinguish between EB and WB ramp terminal intersections, and therefore total interchange collisions are reported.

The highest number of collisions was concentrated in the vicinity of Missouri Flat Road and US 50 Interchange with 21 reported collisions from 2012 to 2014. The intersection with the second highest number of collisions occurred at the El Dorado Road/US 50 Interchange and Missouri Flat Road/Pleasant Valley Road intersection with 6 reported collisions.

The most common type of collision was Rear End as noted in Table 8 below. There were 29 Rear End collisions over the three-year period which continued to steadily increase from 8 reported collisions in 2012 to 12 in 2014. The second most common type of collision was Broadside with 12 reported collisions. The third most common type of collision was Hit Object with 7 collisions.

Table 8: Collision Type by Year

Type of Collision	2012	2013	2014	TOTAL
Head On	0	0	1	1
Sideswipe	2	0	0	2
Rear End	8	9	12	29
Broadside	4	5	3	12
Hit Object	1	4	2	7
Overturned	1	1	0	2
Vehicle/Pedestrian	1	0	2	3
Vehicle/Bicyclist	1	1	1	3

The Annual Accident Location Study (AALS) for 2015 was completed by the County of El Dorado Transportation Division in March 2016. The study is conducted annually by the Transportation Division to review the collision experience along the County's 1,080 miles of maintained roads. The crash rate is calculated based on annual average crashes per Million Entering Vehicles (MEV). A benchmark of 1.00 crash/MEV is adopted as County's acceptable rate for single sites, such as an intersection. Any site with a crash rate of 1.00 or above is considered for additional action. Based on this threshold, the 2015 report identified 18 locations that require further investigation based on high crash rates and/or severity. Within the study area, all the intersections determined to be in satisfactory conditions as marked by characteristics such as low crash rates, low severity and crashes not related to roadway conditions, with exception to Forni Road in the vicinity of Missouri Flat Road. Forni Road from Post Mile 1.86 to 2.08 in the vicinity of Missouri Flat Road experienced a crash rate of 1.00 MEV and is recommended for further investigation.

KEY FINDINGS

A summary of key findings are provided below.

- One study intersection (Missouri Flat Road and China Garden Road #10) currently exceeds the County's LOS standards during the AM and PM peak hours. At this intersection and one additional intersection (Missouri Flat Road and Enterprise Drive #12), the peak hour volumes warrant a signal control. It should be noted that the planned Diamond Springs Parkway would help to relieve traffic congestion on Missouri Flat Road between China Garden Road and Pleasant Valley Road.
- The County's Capital Improvement Program (CIP) includes a line item for improvements to intersections. The County annually monitors intersections with potential need for improvement through the Intersection Needs Prioritization Process. The information is then used to inform the annual update to the CIP and potential intersection improvements can be added, by the Board of Supervisors, to the CIP as funding becomes available.
- The estimated 95th percentile queues for a few individual movements at the study intersections exceed the available storage, although the queues were not observed to adversely affect the upstream facilities.
- The study roadway segments currently operate within County's LOS standards.
- There are no existing deficiencies for freeway mainline segments and merge-diverge influence areas along US 50 within the study area.
- The highest number of collisions was concentrated in the Missouri Flat Road and El Dorado Road interchange areas, although there are no obvious trends that can determine the causes of these collisions. County's 2015 AALS report identified Forni Road in the vicinity of Missouri Flat Road as one of the 18 locations requiring further review.
- The most common collision type was rear-end, followed by broadside.
- Low pedestrian and bicycle activities occur in the study area.

APPENDIX A: LEVEL OF SERVICE CRITERIA

Table A.1: Signalized and Unsignalized Intersection Level of Service Criteria

LOS	Average Delay (sec/veh)		Description
	Signalized	Unsignalized	
A	<10.0	<10.0	Very Low Delay: This occurs when progression is extremely favorable and most vehicles arrive during a green phase. Most vehicles do not stop at all.
B	>10.0 & ≤20.0	>10.0 & ≤15.0	Minimal Delays: This generally occurs with good progression, short cycle lengths, or both. More vehicles stop than at LOS A, causing higher levels of average delay.
C	>20.0 & ≤35.0	>15.0 & ≤25.0	Acceptable Delay: Delay increases due to only fair progression, longer cycle lengths, or both. Individual cycle failures (<i>to service all waiting vehicles</i>) may begin to appear at this level of service. The number of vehicles stopping is significant, though many still pass through the intersection without stopping.
D	>35.0 & ≤55.0	>25.0 & <35.0	Approaching Unstable/Tolerable Delays: The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	>55.0 & ≤80.0	>35.0 & ≤50.0	Unstable Operation/Significant Delays: These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent occurrences.
F	>80.0	>50.0	Excessive Delays: This level, considered to be unacceptable to most drivers, often occurs with oversaturation (i.e., when arrival flow rates exceed the capacity of the intersection). It may also occur at high v/c ratios below 1.00 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.

Table A.2: Signalized and Unsignalized Intersection Level of Service Criteria

Functional Classification	Number of Lanes	Planning Level Volume Threshold (vehicles per hour)				
		LOS A	LOS B	LOS C	LOS D	LOS E
Arterial, Divided	2	-	-	890	1,610	1,730
	4	-	-	1,850	3,220	3,290
	6	-	-	2,760	4,680	4,710
Arterial, Undivided	2	-	-	850	1,540	1,650
	4	-	-	1,760	3,070	3,130
Multi-Lane Highway	4	-	2,240	3,230	4,250	4,970

Notes:
 Two-lane highway (and arterial 2-lane) thresholds are based on HCM 2010, Exhibit 15-30, Class II Rolling, .09 K-factor, and D-factor of 0.6
 Arterial volume thresholds are based on HCM 2010, Exhibit 16-14, K-factor of 0.09, posted speed 45 mi/h
 Volumes are for both directions

Table A.3: Basic Freeway Segment Level of Service Criteria

LOS	Density (pc/mi/ln)
A	≤ 11
B	> 11-18
C	> 18-26
D	> 26-35
E	> 35-45
F	Demand exceeds Capacity
	> 45
